Department of Information Technology (B.Sc.I.T Semester V)
Artificial Intelligence Application Development Practical
Module - II
Practical – III

Roll No.:T054	Name:Priti Yadav
Class:TYIT	Batch:2
Date of Assignment: 02/09/26	Date/Time of Submission: 02/09/26

3. Issue Types & Configuration.

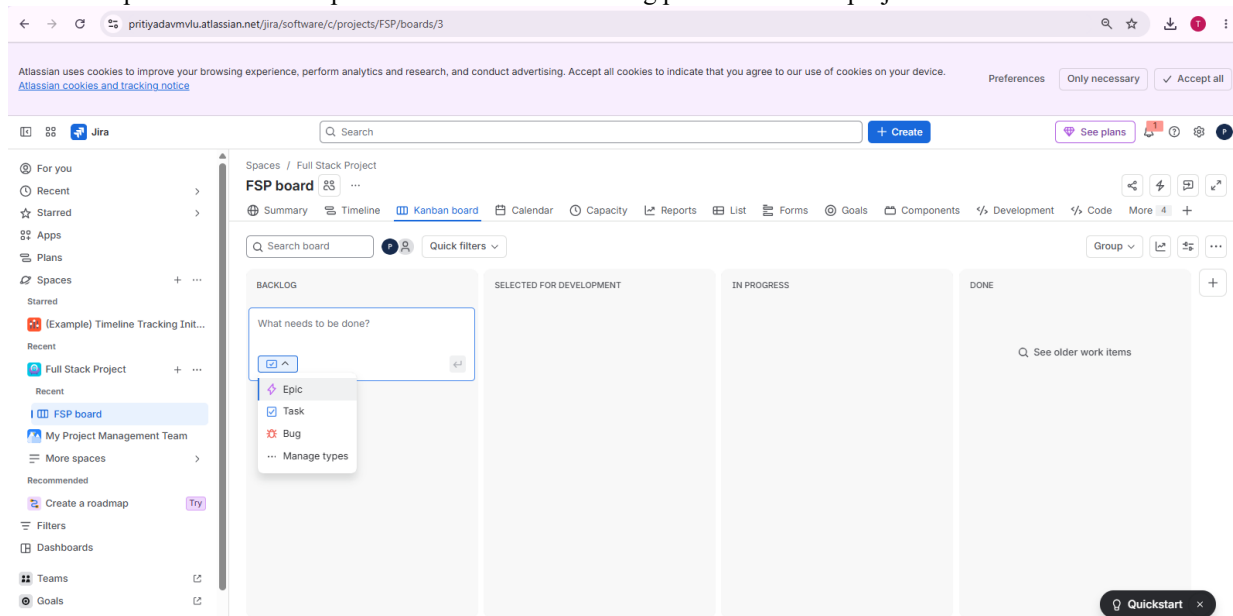

A. Create and configure Issue Types (Epic, Story, Task, Bug).

Step 1: Open the Full Stack Project board

1. Open Jira.
2. Open the previously created Full Stack Project.
3. Open the FSP board.

Why are we doing this?

We open the project board because the Kanban board is where project work items or issues are created and tracked. The board provides a visual representation of the work being performed in the project.

Step 2: Understand the Kanban columns

The board contains different columns representing different stages of work:

Backlog → Selected for Development → In Progress → Done

Why are we doing this?

These columns help the team understand the current status of each issue.

For example:

- Backlog – Work that has been planned but not started.
- Selected for Development – Work selected for development.
- In Progress – Work currently being performed.
- Done – Work that has been completed.

This makes project progress easy to understand visually.

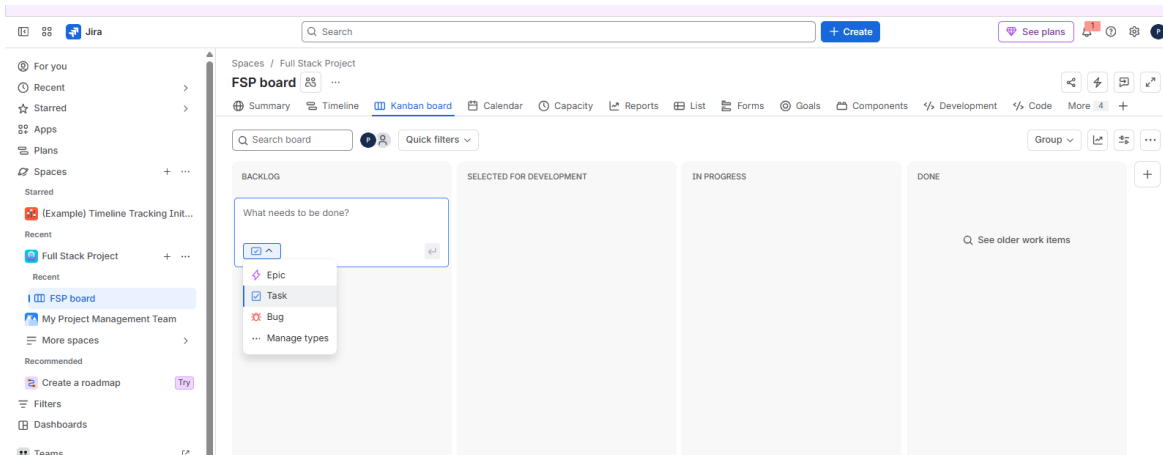

Step 3: Create a new issue

1. Go to the Backlog column.
2. Click Create.
3. A new issue card will appear.
4. The card contains the field “What needs to be done?”
5. Enter the name of the work item.

Example: Team Interaction

Why are we doing this?

An issue is created to record a particular piece of work that needs to be performed. Giving it a suitable name makes the purpose of the work easy to understand.

Step 4: Select the Issue Type

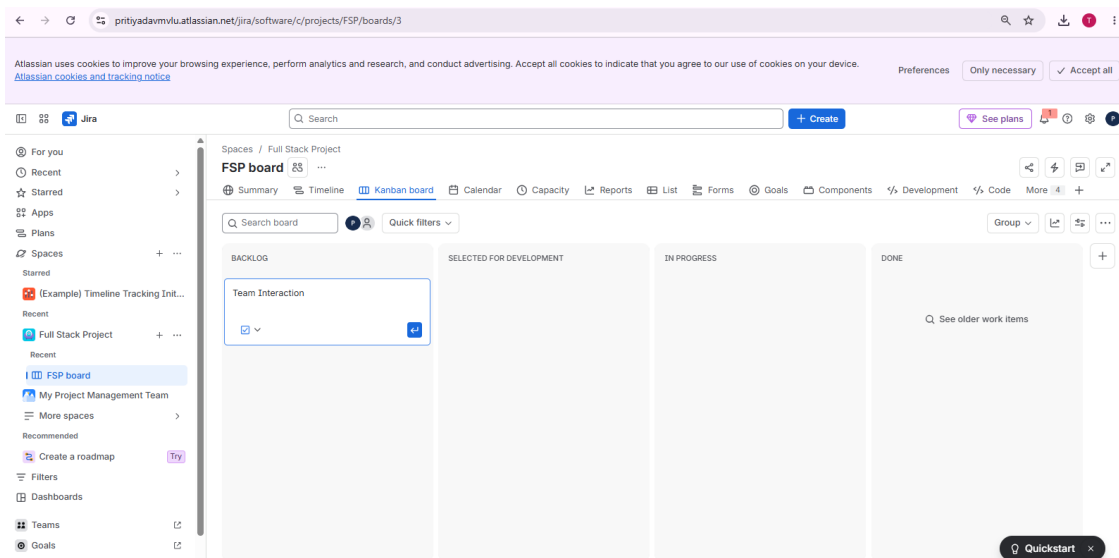

1. Click the issue-type icon/drop-down on the issue card.
2. The available issue types will be displayed.
3. Select the appropriate issue type.

The practical shows:

- Epic
- Task
- Bug

Why are we doing this?

Selecting an issue type tells Jira what kind of work the issue represents. It helps organize and manage different types of project activities.

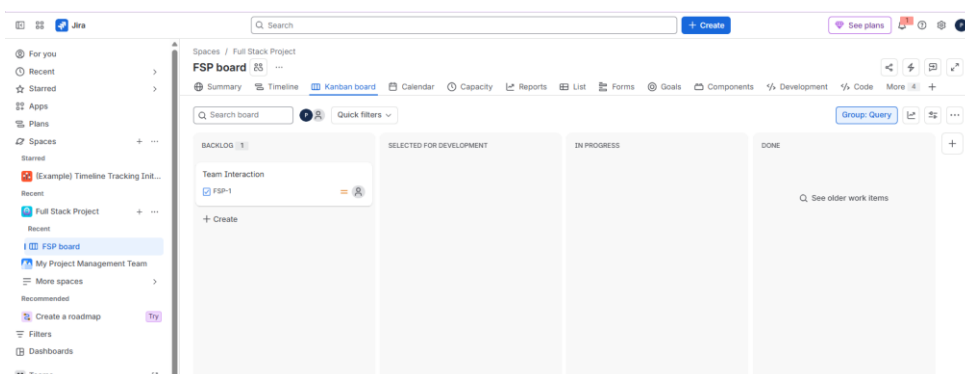

Step 5: Create a Task

1. For a normal activity, select Task.
2. Enter a suitable task name.
3. Example: Team Interaction
4. Click the Create/Enter button.
5. The task will appear as a card in the Backlog column.

Why are we doing this?

A Task is used for a specific piece of work. Creating a task allows the team to record and track that activity on the Jira board.

Step 6: Create a Bug

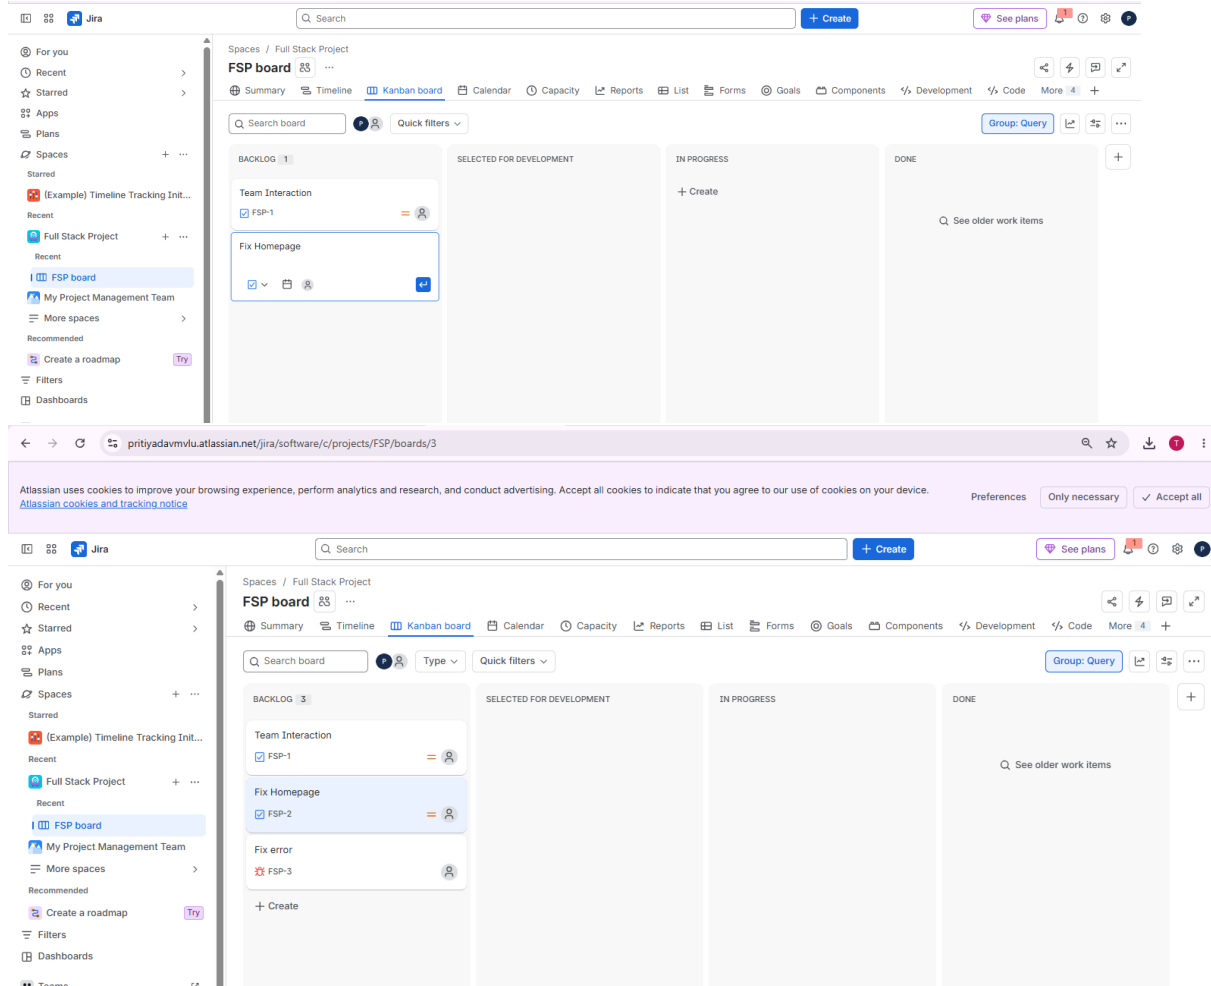

1. Create another issue.
2. Open the issue-type drop-down.
3. Select Bug.
4. Enter the bug name.

Example: Fix Homepage

5. Create the issue-The bug will be represented using the Bug issue type/icon.

Why are we doing this?

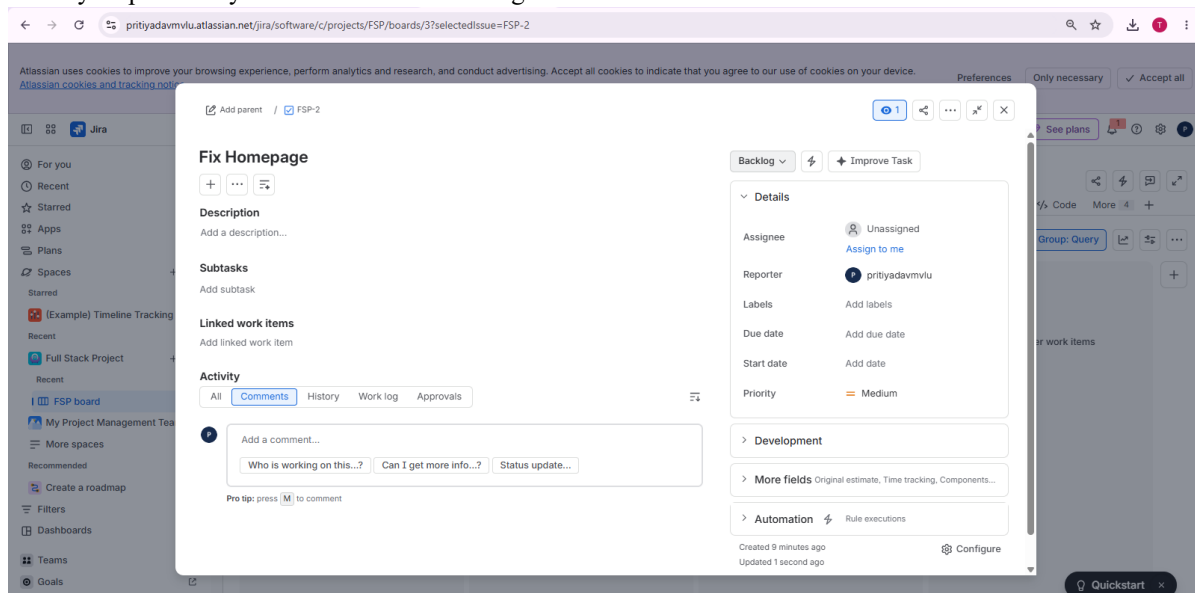

A Bug is used to record a problem or defect in the project. Separating bugs from normal tasks makes it easier for the development team to identify and fix problems.

Step 7: Select the required group member from the list.

Why are we doing this?

The Assignee specifies the team member who is responsible for working on the Fix Homepage Bug. This helps the team clearly identify responsibility and track who is handling the issue.

RESULT:-

The “Fix Homepage” Bug was successfully assigned to the required group member.

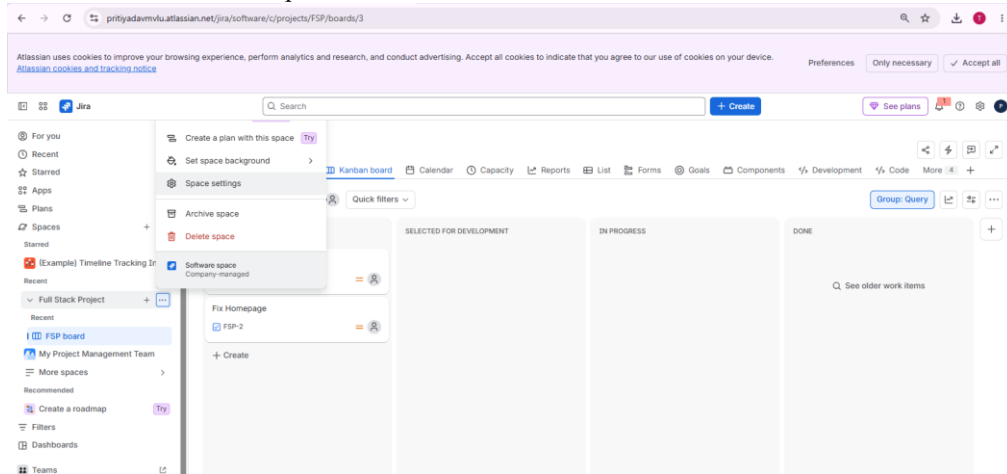

B. Create Components and Versions.

Step 1: Open Space Settings

1. Open the Full Stack Project.
2. Go to Space Settings.

Why are we doing this?

Space Settings contains configuration options that allow us to manage different aspects of the Jira project, including releases/versions and components.

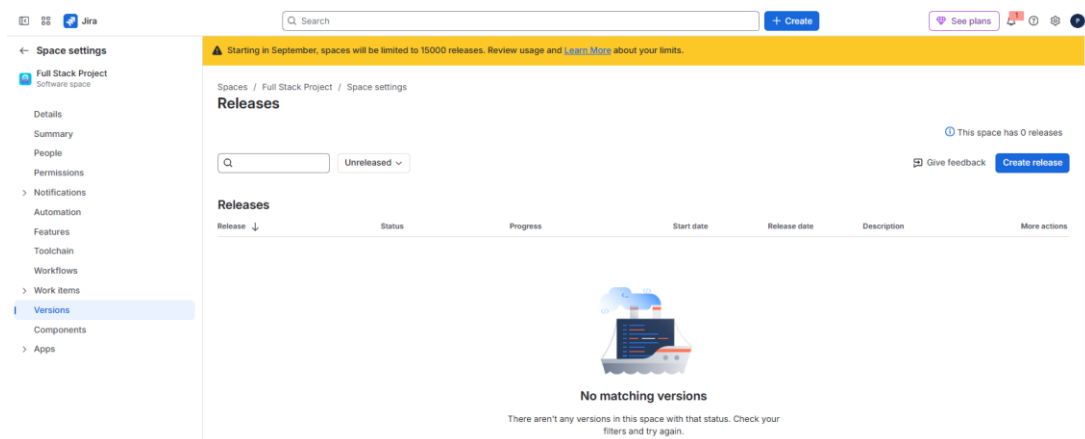

Step 2: Create a Release

1. In Space Settings, select Create Release.
2. Enter the required release/version details.

Why are we doing this?

A release represents a particular version or stage of the project. Creating a release helps the team organize work that is planned for that version.

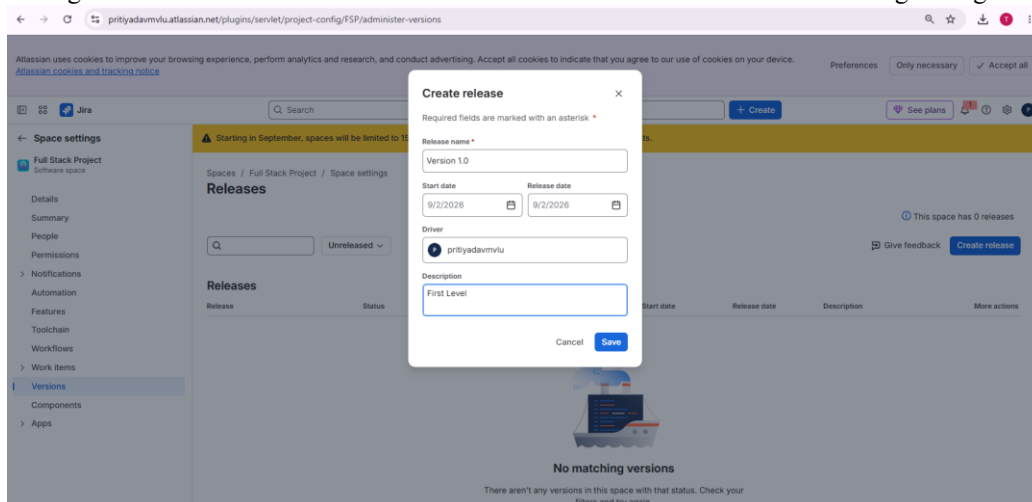

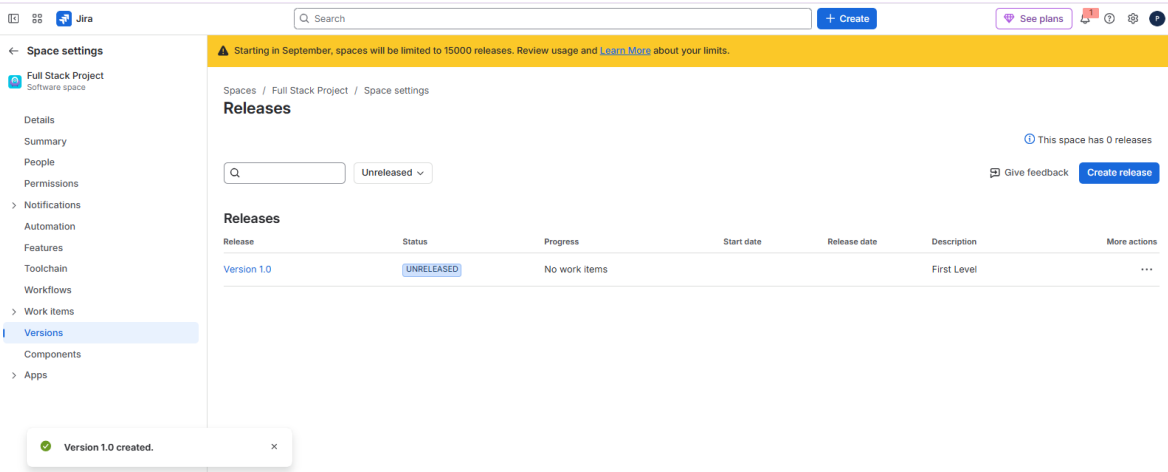

Step 3: Save the Release

1. Enter the required details.
2. Click Save.
3. The created version will appear in the Version list.

Why are we doing this?

Saving the release stores the version information in Jira so that it can be used for organizing and tracking project work.

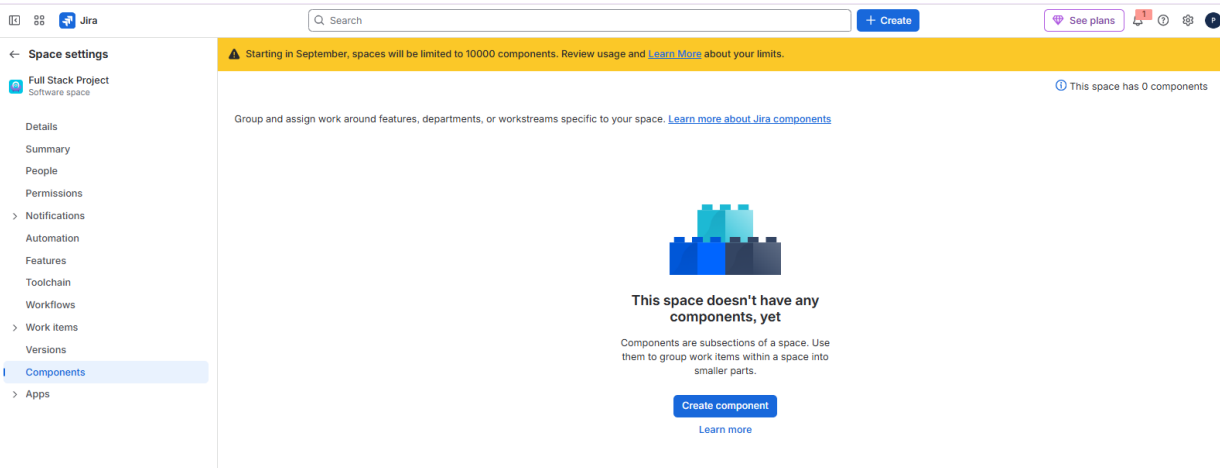

Step 3: Save the Release

1. Enter the required details.
2. Click **Save**.
3. The created version will appear in the Version list.

Why are we doing this?

Saving the release stores the version information in Jira so that it can be used for organizing and tracking project work.

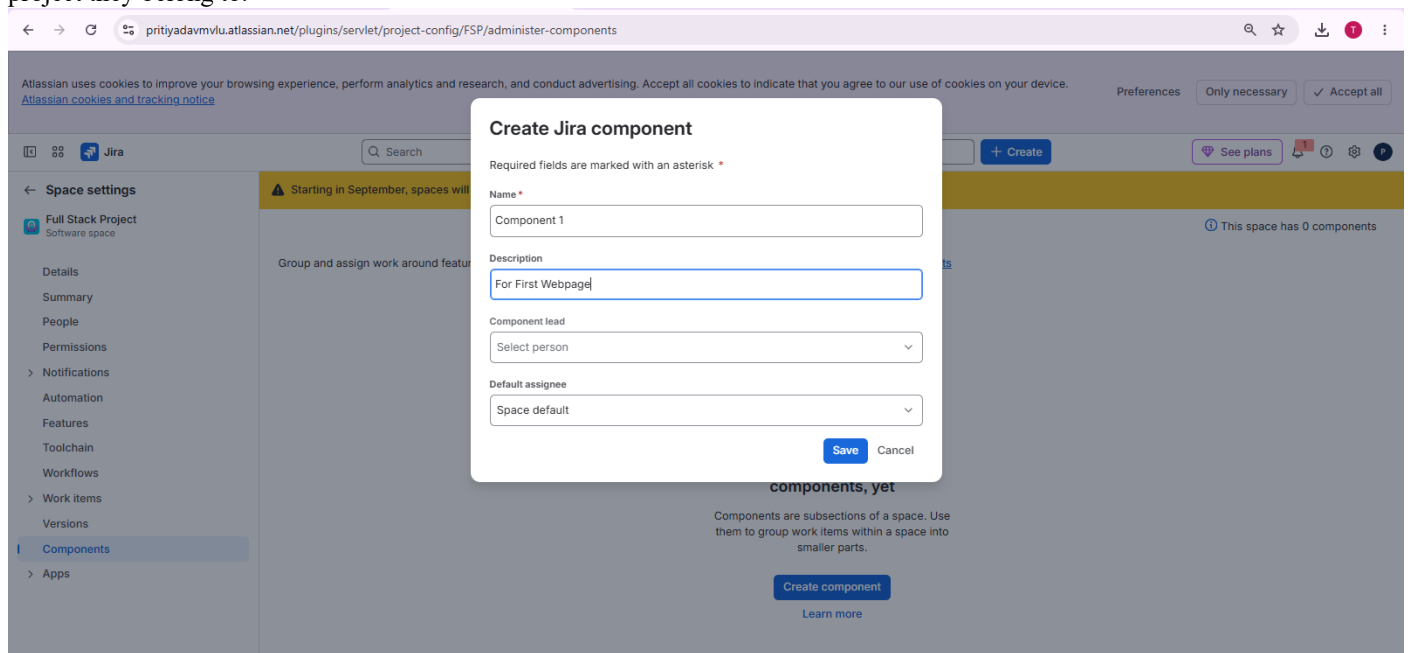

Step 4: Open Components

1. In **Space Settings**, click **Components**.
2. Select the option to create a component.

Why are we doing this?

Components divide a project into smaller functional areas. This makes it easier to organize issues and identify which part of the project they belong to.

Step 5: Enter Component Details

1. Enter the required component details.
2. Click **Save**.

Why are we doing this?

Entering component details gives the component a proper identity and purpose within the project.

The screenshot shows the Jira 'Space settings' page for a 'Full Stack Project' (Software space). The left sidebar lists various settings like Details, Summary, People, Permissions, Notifications, Automation, Features, Toolchain, Workflows, Work items, Versions, and Components (which is selected). The main content area shows a warning about component limits and a 'Create component' button. Below this is a search bar and a table of components. The table has columns for Component, Description, Component lead, Default assignee, Issues, and More actions. One component is listed: 'Component 1' with description 'For First Webpage' and '0 issues'. A notification at the bottom left states 'Component 1 added'.

Component	Description	Component lead	Default assignee	Issues	More actions
Component 1	For First Webpage		Project default	0 issues	...

Step 6: Verify the Component

1. After saving, check the **Component list**.
2. The newly created component will appear in the list.

Why are we doing this?

Checking the component list confirms that the component has been successfully created and is available for use in the project.

RESULT:

different issue types were created to organize project work, while Releases/Versions and Components were created to structure and manage the project efficiently in Jira.
